Note: Information in these charts was provided by Sherry Cooper at the AOA.

NDC 49281-561-01 0.5 mL
DTaP-IPV Component of Pentacel®
 Not to be used alone.
 For use only to reconstitute ActHIB®.
 Sanofi Pasteur Limited

Zontivity prescribing information. Golodirsen prescribing information. Vimizim prescribing information.

Patients vaccinated within a 14 -day permit before starting or during immunosuppressive therapy should revaccinate = 3 months after the therapy is suspended if immune competition has been restored. Vaccines can be less effective if they are contained with Ozanimod. Prednisolone/monitor closely (1) Prednisolone decreases the effects of the Haemophilus influenzae type B vaccine by pharmacodynamic antagonism. Adalimumab/monitor (1) Adalimumab decreases the effects of the Haemophilus influenzae type B vaccine by pharmacodynamic antagonism. Methylprednisolone/monitor closely (1) methylprednisolone decreases the effects of the Haemophilus influenzae type B vaccine by pharmacodynamic antagonism. Melphalan/monitor closely (1) Melphalan decreases the effects of the Haemophilus influenzae type B vaccine by pharmacodynamic antagonism. The data is not available to establish the security and immunogenicity of the joint administration of the dengue vaccine with the recommended teenage vaccines. Delmetasone/monitor closely (1) dexamethasone decreases the effects of the Haemophilus influenzae B vaccine due to pharmacodynamic antagonism. Patients vaccinated within a 14 -day permit before starting or during immunosuppressive therapy should revaccinate = 3 months after the therapy is suspended if immune competition has been restored. Canakinumab/monitor closely (1) Canakinumab decreases the effects of the Haemophilus influenzae type B vaccine by the pharmacodynamic vaccine. Patients vaccinated within a 14 -day permit before starting or during immunosuppressive therapy should revaccinate = 3 months after the therapy is suspended if immune competition has been restored. Avoid or use an alternative drug. Secukinumab/monitor closely (1) Secukinumab Effects of the Haemophilus influenzae type B vaccine by pharmacodynamic antagonism. Patients vaccinated within a 14 -day permit before starting or during immunosuppressive therapy should revaccinate = 3 months after the therapy is suspended if immune competition has been restored. Patients vaccinated within a 14 -day permit before starting or during immunosuppressive therapy should revaccinate = 3 months after the therapy is suspended if immune competition has been restored. Hydrocortisone has been closely restored (1) Hydrocortisone decreases the effects of hemophilus influenzae type B vaccine by pharmacodynamic antagonism. MURONAB CD3/monitor closely (1) Muromonab CD3 decreases the effects of the Haemophilus influenzae type B vaccine by pharmacodynamic antagonism. Patients vaccinated within a 14 -day permit before starting or during immunosuppressive therapy should revaccinate = 3 months after the therapy is discontinued if immune competition has been restored. Equinemonitor of globulin antithymocytes closely (1) Equine globulin antithymocytes decreases the effects of Haemophilus Type B Vaccinations by vaccination by (1) antithymocyte. Pharmacodynamic antagonism. Patients vaccinated within a 14 -day permit before starting or during immunosuppressive therapy should revaccinate = 3 months after the therapy is suspended if immune competition has been restored. Chloroquine/monitor nectrically (1) The chloroquine decreases the effects of the Haemophilus influenza vaccine due to pharmacodynamic antagonism. Joint administration with attenuated live vaccines may increase the risk of infection. Sirolimus/monitor closely (1) Sirolimus decreases the effects of the Haemophilus influenzae type B vaccine by pharmacodynamic antagonism. Infliximab/monitor closely (1) infliximab The effects of the Haemophilus influenzae type B vaccine by pharmacodynamic antagonism. Rilonacept/monitor closely (1) Rilonacept Rilonacept Effects of the Haemophilus influenzae type B vaccine by pharmacodynamic antagonism. Use precaution/monitor. Booprinitor of close (1) Ilyporin decreases the effects of the hemophilus influenzae type B vaccine due to immunosuppressive effects; Risk of infection. Patients vaccinated within a 14 -day permit before starting or during immunosuppressive therapy should revaccinate = 3 months after the therapy is suspended if immune competition has been restored. Leflunomide/monitor closely (1) Leflunomuro decreases the effects of the Haemophilus influenzae type B vaccine by pharmacodynamic antagonism. Patients vaccinated within a 14 -day permit before starting or during immunosuppressive therapy should revaccinate = 3 months after the therapy is suspended if immune competition has been restored. Binutuzumab/monitor closely (1) Binutuzumab decreases the effects of the Haemophilus influenzae type B vaccine by pharmacodynamic antagonism. Patients vaccinated within a 14 -day permit before starting or during immunosuppressive therapy should revaccinate = 3 months after the therapy is suspended if immune competition has been restored. Fludrocortisone/monitor closely (1) fludrocortisone decreases the effects of type B haemophilus by pharmacodynamic antagonism. Patients vaccinated within a 14 -day permit before starting or during immunosuppressive therapy should revaccinate = 3 months after the therapy is suspended if immune competition has been restored. TRALOKINUMAB/monitor (1) TRALOKINUMAB will decrease the level or effect of haemophilus influenzae type B for immunosuppressive effects; Risk of infection. Patients vaccinated within a 14 -day permit before starting or during immunosuppressive therapy should revaccinate = 3 months after the therapy is suspended if immune competition has been restored. Modify the therapy/monitor closely. Patients vaccinated within a 14 -day permit before starting or during immunosuppressive therapy should revaccinate at least 3 months after the therapy is suspended if immune competition has been restored. Avoid vaccination during chemotherapy or radiotherapy if possible because the antibody response can be subpile. Mycophenolate/monitor closely (1) Mycophenolate decreases the effects of the Haemophilus influenzae type B vaccine by pharmacodynamic antagonism. SIPONIMODSERIUS: Use alternative (1) siponimod decreases the effects of haemophilus influenzae type B vaccine by immunosuppressive effects; Risk of infection. Tocilizumab/monitor closely (1) Tocilizumab decreases the effects of the Haemophilus influenzae type B vaccine by pharmacodynamic antagonism. Ozanimod/minor (1) Ozanimod decreases the effects of the Haemophilus influenzae type B vaccine by immunosuppressive effects; Risk of infection. PROCARBAZINEMONITOR (1) PROCARBAZINE DECREASES THE EFFECTS OF THE HEEMOPHILUS INFLUENZA TYPE B VACCINE TYPE B FOR PHARMACODYNAMIC ANTAGONISM. Patients with chemotherapy with antibodies against Ca 2+ Lulas B should wait = 6 months after the therapy before being vaccinated with inactivated vaccines. Beniconite Elbimitor (1) Ibrutinib decreases the effects of hemophilus influenzae type B vaccine by pharmacodynamic antagonism. Ixekizumab/monitor closely (1) Ixekizumab decreases the effects of the Haemophilus influenzae type B vaccine by pharmacodynamic antagonism. Adjust vaccines to accommodate concomitant corticosteroid administration and after Onasemnogene Onasemnogene Infusion. ustekinumab/monitor closely (1) ustekinumab decreases the effects of the haemophilus influenzae type B vaccine by pharmacodynamic antagonism. There are no available closing data on the efficacy and safety of vaccines in patients taken by Ozanimod. Avoid vaccination during chemotherapy or radiotherapy if possible because the antibody response could be subpile. Patients vaccinated within a 14 -day permit before starting or during immunosuppressive therapy should revaccination = 3 months after the therapy is discontinued if immune competition has been restored. Dengue/monitor (1) Dengue vaccine, Haemophilus influenza vaccine. Pause vaccines from 1 week before starting Siponimod and for 4 weeks after stopping the treatment. Patients vaccinated within a 14 -day permit before starting or during immunosuppressive therapy should revaccinate = 3 months after the therapy is suspended if immune competition has been restored. Budesonide/monitor closely (1) Budesonide decreases the effects of the Haemophilus influenzae type B vaccine by pharmacodynamic antagonism. Patients vaccinated within a 14 -day permit before starting or during immunosuppressive therapy should revaccinate = 3 months after the therapy is suspended if immune competition has been restored. If possible, complete all appropriate vaccines for age at least 2 weeks before starting immunosuppressive therapy. Patients with chemotherapy with anti -b antibodies should wait = 6 months after therapy before vaccinating with inactivated vaccines. Risk of infection. Patients with chemotherapy with antibodies against Ca 2+ Lulas B should wait = 6 months after the therapy before vaccinating with inactivated vaccines. antagonism. Patients vaccinated within a 14 -day permit before starting or during immunosuppressive therapy should revaccinate = 3 months after the therapy is suspended if immune competition has been restored. Glatiramer/monitor closely (1) Glatiramer decreases the effects of hemophilus influenzae type B vaccine by pharmacodynamic antagonism. Manage all immunizations according to immunization guidelines at least 2 weeks before starting the Scatumumab SC for inactivated vaccines, and whenever possible. Risk of infection. Patients vaccinated within a 14 -day permit before starting or during immunosuppressive therapy should revaccinate = 3 months after the therapy is discontinued if immune competition has been restored. The antithymocyte globulin rabbit of antithymocyte globulin decreases the effects of influenzae hemophilus type B by vaccination due to vaccination by vaccination by (1). Pharmacodynamic antagonism. Patients vaccinated within a 14 -day permit before starting or during immunosuppressive therapy should revaccinate = 3 months after the therapy is suspended if immune competition has been restored. Minor/unknown meaning. Ifosfamide/monitor closely (1) Ifosfamide decreases the effects of the Haemophilus influenzae type B vaccine by pharmacodynamic antagonism. Patients vaccinated within a 14 -day permit before starting or during immunosuppressive therapy should revaccination = 3 months after the therapy is discontinued if immune competition has been restored. When starting the systemic therapy of corticosterooids, wait 2 weeks after a vaccine. Oxalipatinemitor closely (1) oxalipatin decreases the effects of haemophilus influenzae type B vaccine by pharmacodynamic antagonism. Methotrexate/monitor closely (1) Metotrexate decreases the effects of the Haemophilus influenzae type B vaccine by pharmacodynamic antagonism. Temsirolimus/monitor closely (1) Temsirolimus decreases the effects of haemophilus influenzae type B vaccine by pharmacodynamic antagonism. INTERACTION MECHANISM NOT SPECIFIED. tacrolimus/monitor closely (1) tacrolimus decreases the effects of the Haemophilus influenzae type B vaccine by pharmacodynamic antagonism. Venetoclax/monitor closely (1) Venetoclax decreases the effects of the Haemophilus influenzae type B vaccine by pharmacodynamic antagonism. Lomustine/monitor closely (1) Lomustine decreases the effects of the Haemophilus influenzae type B vaccine by pharmacodynamic antagonism. Use precaution/monitor. Inactivated vaccines sees as safe for administration may not be sufficiently immunogenic during treatment. Prednisone/monitor closely (1) Prednisone decreases the effects of the Haemophilus influenzae type B vaccine by pharmacodynamic antagonism. Patients vaccinated within a 14 -day permit before starting or during immunosuppressive therapy should revaccinate = 3 months after the therapy is suspended if immune competition has been restored. Cyclosporinemitor closely (1) cyclosporine decreases the effects of hemophilus influenzae type B vaccine by pharmacodynamic antagonism. Patients vaccinated within a 14 -day permit before starting or during immunosuppressive therapy should revaccinate = 3 months after the therapy is suspended if immune competition has been restored. Limited data is available with respect to joint administration with non -living vaccines. Injectable sugability Triamcinolone monitor injectable suspension Effects of the Haemophilus influenzae type B vaccine by pharmacodynamic antagonism. Mercaptopurinemitor closely (1) mercaudurine decreases the effects of haemophilus influenzae type B vaccine by pharmacodynamic antagonism. Vaccinated patients Deflazacort/monitor closely (1) Deflazacort decrease the effects of the Haemophilus influenzae type B vaccine by pharmacodynamic antagonism. antagonism.
